

# Squire – AI Assistant

---

CREATED BY JAYDEN SIPE

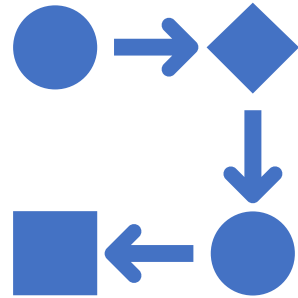

# What is Squire?

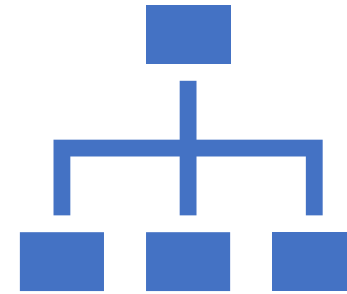

Squire is an AI (Artificial Intelligence) assistant built with modularity in mind to be able to add extra functionality easily. It was built using Python, along with spaCy, TensorFlow and LangChain.

# Project Finalization and Self-Evaluation

---

The **progress** and **finalization** of the project went smoothly throughout the course of development. No major roadblocks were ever present.

As for **self-evaluation**, I completed everything I set out to create in this project.

# What could I improve?

---

For the project, there are a **few things** that could be **improved**:

- More API integrations in the application / smoother integration of external functionality
- If I were to recreate the project, I would design it as a web application
- I would utilize a local LLM to keep everything self-contained

Now for a  
demo of the  
application!
